To Train The Model-Model Building

we are going to train Linera Regression Model;We need to split out data into two variables x and y where x is independent variable(input) and y is dependent on x(output) we could ignore address column as it required for our model

In [12]:
```
x=df1[['Birth Rate', 'Calling Code',
       'Fertility Rate', 'Infant mortality',
      'Life expectancy', 'Maternal mortality ratio','Latitude','Physicians pe
      'Longitude'
      ]]
y=df1['Physicians per thousand']
```

To Split my dataset into training and test data

In [13]:
```
from sklearn.model_selection import train_test_split
x_train,x_test,y_train,y_test=train_test_split(x,y,test_size=0.3)
```

In [14]:
```
from sklearn.linear_model import LinearRegression
lr= LinearRegression()
lr.fit(x_train,y_train)
